

InControl Support Note #138982

Daylight Saving Time Change

Beginning in 2007, daylight saving time (DST) will be extended in the United States. DST will start on March 11, 2007, which is three weeks earlier than usual, and it will end on November 4, 2007, which is one week later than usual. This results in a new DST period that is four weeks longer than in previous years. Unless certain updates are applied to your computer, the time zone settings for your computer's system clock may be incorrect during this four-week period. In particular, you must make sure that both your Windows operating system and your calendar programs are updated.

InControl Technology Inc. MasterControl Solution

There are no known daylight savings time issues within MasterControl itself. You should make sure that the application server and database server has been patched with the Daylight Updates – information about the update is provided below. This patch was released as non-critical, so the patch may have to be manually selected.

In the event the patch was not applied, for a three week period these are the following non-critical issues you will see:

- Your scheduled iScanner scans would occur 1 hour earlier
- Scan dates would be off by 1 hour

Important Note: InControl MasterControl solution can be used to track and find all Windows devices that do not have the applied patches using the Advanced Search Engine.

General order of updating for DST changes:

- Apply and verify updates to server operating systems (KBs 931836 and 914387)
- If you are running Outlook Web Access, Exchange Lotus Notes connector, or BlackBerry Enterprise Server for Microsoft Exchange , install the Exchange Patch CDO.DLL (KB 926666)
- Update your Windows client operating systems if they already have not been updated using Windows Update or Windows Server Update Services (KBs 931836 and 914387)
- Correct individual e-mail application calendars using the Outlook Time Zone Update Tool (KB 931667)
