## InControl Technology announces the availability of ITGreen “*MasterControl for Energy*”

**Organizations with 1000 PC’s using MasterControl for Energy could  
save \$175,828 annually reducing greenhouse emissions by 1300 tons.**

**San Diego, May 2, 2007:** InControl Technology, Inc., a leading supplier of 100% Web-based IT Asset Management solutions, today announced the introduction of ITGreen offering to the market.

As part of our ongoing effort to help all organizations large and small provide ongoing and expansive real time view of their IT Asset and technology landscape, we have now adapted our offering to create data for identifying the energy consumption and emission data of technology assets. In addition, the InControl team has developed a dynamic calculator that provides organizations with a guide for evaluating the current state, creating metrics for Best Practices and processes to lower energy costs and dramatically decrease greenhouse emissions. In conjunction with this solution, all organizations will be able to take advantage of the associated lowering of energy costs across the technology landscape.

InControl is developing a comprehensive library of technology assets for the basis of comparison to what a company is currently using. This data can be imported into the energy calculator for proactive decision making in technology refresh projects, allowing the organization to select the best options for energy consumption in procurement without sacrificing performance.

One computer left on 24 hours a day  
dumps 3,522 pounds of CO<sup>2</sup> into the  
atmosphere annually.

“ITGreen further defines the concept of true Asset Intelligence, a central repository for powerful decision making across the business,” said Ben McCullom VP sales and Operations for InControl Technology. He further states, “With ITGreen we are committed to the concept of corporate governance and responsibility in addressing the serious issues of Global Warming.”

### **About InControl Technology, Inc.**
