Press Release

InControl Technology Announces the Upcoming Availability of
InControl Explorer.

**InControl's fast, accurate and automated deep discovery & inventory solution
for IT asset management works with low impact on existing IT resources.**

San Diego, July 19, 2006: InControl Technology, Inc., a leading supplier of 100% Web-based IT Asset Management solutions, today announced the availability of its Windows .NET-based InControl Explorer Asset Control Solution. InControl Explorer provides small to mid-size enterprises with a fast, affordable and accurate inventory of their current IT infrastructure linking the asset information to contracts, people and locations without further burdening limited IT resources. A precise, up-to-date inventory of the IT infrastructure forms the foundation of technology and business focused initiatives including: software audits to ensure license compliance; identification of IT assets of all types; planning and roll-out of a new application or update; migrating to a new Operating System release; evaluating IT capacity and planning; or preparing for a desktop refresh. Built for Small to Medium Businesses or enterprise departments seeking to fully identify and account for such assets as components and software, this powerful yet compact solution can be purchased, downloaded and installed from the InControl Web site in 30 minutes or less.

**“Companies and Public service organizations are spending millions on ITAM,
CMDB and change initiatives that are failing due to a lack of consistent, trusted
data in ever changing IT environments”**

A Windows-based application using the popular Access Database, InControl Explorer leverages InControl's existing iScanner technology and powerful reporting capabilities while maintaining a familiar Windows Explorer look and feel.

Typically, an in-house discovery and inventory effort can take weeks or months – time that will increase the risk of a high priority IT project. InControl Explorer installs on the network (hosted or on-site) and begins the discovery process in under 30 minutes. Within 48 hours (time is dependent on the size of the network), the organization will have a complete overview of the networked IT infrastructure and a detailed hardware and software inventory of every network-attached device. InControl Explorer is fast, requires little administrative support, and delivers a very compelling return on investment.

“Our customers often need a baseline assessment of their IT infrastructure in order to address pressing operational needs or facilitate planning and budgeting for IT assets. Due to time or budget constraints, they can't wait to implement a risky and expensive client-based inventory product”, said Ben McCullom, Executive Vice President. InControl Explorer takes the heavy lifting out of generating the information needed to immediately mitigate risk, conduct audits, or measure the cost and risk of an acquisition and merger.
