

**Intelligent  
Asset Management**

**Key Features at a Glance**

- ❑ First Intelligent solution for Asset Management
- ❑ Agent-less discovery and Inventory
- ❑ Integrates with Existing Infrastructure – CRM, ERP, Service Desk
- ❑ Automated discovery of all Networked assets (hardware, software, networking devices)
- ❑ Asset normalization for reliability
- ❑ WINDOWS .NET framework
- ❑ RDBMS Database
- ❑ Web Based Interface

**Application Support**

- ❑ Life Cycle Management
- ❑ Leasing, purchase & retirement tracking
- ❑ Warranty tracking
- ❑ ITIL compliance reporting
- ❑ Sarbanes-Oxley (SOX) compliance reporting
- ❑ Licensing compliance audit reporting
- ❑ Business planning and business intelligence

**InControl Technology**

**MasterControl™ Asset Intelligence Management Suite Release 3.0**

The MasterControl Suite lets organizations automate the process of IT inventory discovery through the intelligent collection and normalization of asset information, without using software agents. MasterControl eliminates the manual steps in gathering and integrating asset information by automating the collection process that cause errors and increase cost. Leveraging the Microsoft .NET foundation provides seamless integration with enterprise applications and deployment in only a few days. This approach allows companies to lower their deployment costs, lower their life cycle costs and increase business efficiency and asset information accuracy.

**MasterControl Suite**

MasterControl includes the applications necessary to intelligently manage today's complex IT organizations Assets, end-to-end. The MasterControl suite includes iReporter, iScanner, and iBusiness Manager.

**BLT iReporter™**

The BLT iReporter is built on a highly scalable search engine that allows customizable and configurable views of asset information. Ad hoc queries and reports can be viewed daily, monthly or in response to a compelling event, such as a merger or early asset termination. Features of the iReporter include comprehensive reporting for line of business (LOB), asset tracking, security scans, software usage, patch scans and enhanced alarming and notification. The iReporter is integrated with existing enterprise applications such as LDAP directory service and ERP systems. iReporter supports new technologies such as wake-up on LAN and wireless LAN.

**iScanner™**

The iScanner is a core component of the MasterControl system. Where other products rely on 3<sup>rd</sup> party tools or non-integrated subsystems to loosely gather IT data, the iScanner is build into the core architecture and provides the ability to not only collect IT data automatically but also to normalize the data in a way where it can be "trusted" as information. Key features of the iScanner include

Scans of hardware, software, and network devices. For scheduled scanning during non-peak hours, the iScanner allows flexible, timed scans and customizable throttle rates.

*iScanner supports Operating systems including Windows, UNIX, Linux, HP-UX, Solaris, AIX, Embedded OS and many others. iScanner supports handheld devices, printers, and networking equipment, including Cisco and Nortel to name a few..*

**iBusiness Manager™**

The iBusiness Manager provides organization with a single web-based front end for consolidation and tracking of contracts. The iBusiness Manager, virtual filing cabinet, provides the ability to share contracts with multiple organizations allowing better financial accountability and lowering costs. iBusiness Manager supports contracts for hardware purchasing and leasing, software compliance audits, warranties, moves, adds and changes (MACS), financial cost structure, Sarbanes Oxley and ITIL compliance, work flow, and outsourcing. The iBusiness Manger leverages the MasterControl framework to provide business intelligence to Assets.
